

Net Metering & Community Power

Our Community Power programs are committed to supporting the growth of local renewable energy sited at the customer level. Locally generated power can offset other costs that are part of our customers' electric bill, especially if that power is generated at times of peak electricity usage.

Together, our Coalition's member communities have championed state policies that support expansion of New Hampshire's clean energy economy, and we will continue to do so on behalf of our customers.

We aim to expand opportunities for net metering and local renewable energy over time, and to empower customers with new and innovative rates — including net metering rates and time-of-use rates — along with other products and programs to support the growth of a local clean energy economy.

Are Net Metering customers automatically enrolled in Community Power?

No. At this time, net metering customers will NOT be automatically enrolled in Community Power. We cannot yet enroll Net Metering customers because utilities have failed to fully comply with law and regulation to allow us to properly serve Net Metering customers.

When the utilities provide the necessary data, we will offer Net Metering rates and terms to compensate or credit customers for the electricity supply component of their net metered surplus generation, and pursue additional development of net metering rates and programmatic enhancements that will benefit and encourage customers to adopt distributed generation. Please stay tuned for more information for Net Metering customers.
